Formulation	Supplied as a 0.2 μm filtered solution of PBS, pH 7.2–7.4.
Description	Interferon-gamma (IFN- γ), the sole member of the type II interferon family, is a pleiotropic cytokine secreted predominantly by activated T lymphocytes and natural killer cells. The human IFNG gene, located on chromosome 12q15, encodes a 166-amino-acid precursor that is processed into a mature 143-amino-acid glycoprotein. Structural studies demonstrate that biologically active IFN- γ functions as a noncovalent homodimer that signals through the IFN- γ receptor complex. IFN- γ potently activates macrophages, upregulates major histocompatibility complex class I and II antigen presentation, and mediates antimicrobial, antiviral, and antitumor immunity, thereby serving as a central regulator bridging innate and adaptive immune responses.
