<b>Description</b>	<p>HER2 protein, full name Human Epidermal Growth Factor Receptor 2, is an important cell membrane receptor protein and a member of the epidermal growth factor receptor family. HER2 protein plays a crucial role in regulating cell growth, proliferation, and differentiation in normal cells.</p> <p>Abnormal expression of HER2 protein is closely associated with the occurrence and development of various malignant tumors, especially breast cancer, gastric cancer, and ovarian cancer. In tumor cells, overexpression or abnormal activation of HER2 protein can lead to enhanced cell proliferation, migration, and invasion capabilities, thereby promoting tumor growth and spread.</p> <p>Currently, commonly used HER2-targeted drugs in clinical practice include Trastuzumab and Pertuzumab, which can inhibit the growth and spread of tumor cells by blocking the activation of the HER2 signaling pathway, thereby improving patient survival rates and quality of life.</p> <p>In summary, HER2 protein plays a crucial role in the occurrence and development of tumors, and is of great significance for understanding the pathogenesis of tumors, selecting targeted treatment strategies, and evaluating patient prognosis.</p>
